

PRESS RELEASE

## **AMF-Bruns presents the future of materials handling Successful appearance at LIGNA 2017**

20 June 2017

*Apen/Hanover.* AMF-Bruns GmbH & Co. KG made a successful appearance at this year's LIGNA trade fair as an innovative company that is helping to shape the future. The manufacturer of conveying systems from Apen garnered a lot of attention with an emotive presentation at the world's leading trade fair for the wood and forestry industry. To showcase the latest innovations from AMF-Bruns, product images, videos and animations were elegantly combined with a live dance performance on a media wall. The staging drew large numbers of visitors to the stand each day, where they were able to learn about products such as the newly developed trough screw conveyor, the scraper conveyor and the disc screen. The sophisticated sensor technology, which guarantees future process reliability for customers in the case of maintenance work, for example, was presented in cooperation with the company Sensosurf. 'We demonstrated that we are constantly adapting our product range to the latest technical developments, thus adopting a leading role in the field of materials handling,' explained Jan Woltermann, managing director of AMF-Bruns. The concept at the stand in Hanover was a success. The company made a positive impression on its existing customers with its products and also acquired new orders, including with Büttner Energie and Trocknungstechnik GmbH.

AMF-Bruns\_01: Pictures, animations and videos were presented on the multimedia rear wall, providing the perfect setting to showcase the latest innovations from AMF-Bruns.

**AMF-Bruns** is renowned for its high-quality, reliable and customised materials handling systems for bulk materials. Products are individually coordinated based on the customer's specific needs and in accordance with all relevant quality and safety guidelines. This enables procedural steps such as dosing, mixing, cooling and heating to also be integrated. AMF-Bruns takes charge of the planning and engineering of individual components and complete material flow systems, tests using in-house test facilities, production, assembly and commissioning, service and the procurement of replacement parts. Our range includes: screw conveyors, conveyor systems, trough chain conveyors, bucket conveyors, transportation of hot goods, gas-proof and pressure shock-resistant systems, systems in special materials for the use of corrosive and abrasive media.
